diyabc_cat :

This program pools all reftable files of a directory into a single reftable file. This programs requires 2 parameters : the name of the reftableHeader file used to generate all the reftable files to be pooled and the name of the output reftable. diyabc_cat reads the reftableHeader file (which has to be in the same directory), scans all available reftable files present in the directory and select all those with a header that matches the reftableHeader file. The selected files are then copied to a single reftable file. Following with the example above, a command such as :

```
>diyabc_cat mydataanalysis mda
```

will pool all reftable files with header matching mydataanalysis.reftableHeader in an output file named mda.reftable.
